

Amendments to the Claims

Listing of Claims:

1. (currently amended) A method for reducing ~~amplitude mismatch and~~ phase
5 mismatch in quadrature signals in an RF receiver, wherein the quadrature signals
comprises a first signal and a second signal that are at about quadrature phase angles,
the method comprises:
determining a portion of the first signal; and
modifying the second signal by ~~[[a]]~~ the portion of the first signal so that a phase
10 difference between the modified second signal and the first signal becomes
substantially close to 90 degrees; ~~and~~
~~modifying amplitudes of the first signal and or the second signal to substantially~~
~~the same values.~~
- 15 2. (currently amended) The method of claim 1 further comprising:
compensating ~~[[a]]~~ the portion of the first signal to the second signal to reduce phase
mismatch in the pair of quadrature signals.
3. (cancelled)
- 20 4. (currently amended) A method used in an RF receiver for reducing an image cross
talk, the RF receiver comprising:
a first mixer and a second mixer for receiving RF signals and respectively
generating a first signal and a second signal that are at about quadrature phase
25 angles; and
~~an amplitude calibration module coupled to at least one of the first mixer and the~~
~~second mixer, for reducing amplitude mismatch in the pair of quadrature~~

~~signals when the amplitude mismatch causes the image cross talk; and~~
a programmable phase calibration device coupled to the pair of mixers for
reducing phase mismatch in the pair of quadrature signals when the phase
mismatch causes the image cross talk;

5 the method comprising:

utilizing the pair of mixers to process the RF signal and to output the pair of
quadrature signals; and

~~utilizing the programmable amplitude calibration device to reduce the amplitude
mismatch in the pair of quadrature signals; and~~

10 utilizing the programmable phase calibration device to reduce the phase mismatch
in the pair of quadrature signals through modifying the second signal by a
portion of the first signal, wherein two ports of the programmable phase
calibration device are respectively connected to two output ports of the pair
of mixers.

15

5. (currently amended) The method of claim 4 further comprising:

utilizing the programmable phase calibration device to compensate ~~[[a]]~~ the portion
of the first signal to the second signal so that phase difference between the
compensated second signal and the first signal becomes 90 degrees.

20

6. (cancelled)

7. (currently amended) ~~A low-IF~~ An RF receiver comprising:

25 a first mixer and a second mixer for receiving RF signals and respectively
generating a first signal and a second signal that are at about quadrature phase
angles; and

~~an amplitude calibration module coupled to at least one of the first mixer and the
second mixer, for adjusting the amplitude of at least one of the first signal~~

~~and the second signal so as to make the amplitude of the first signal and the second signal substantially equal; and~~
a phase calibration module coupled to at least one of the first mixer and the second mixer, for combining a portion of the first signal with the second
5 signal so as to make the phase difference of the first signal and the second signal substantially equal to 90 degrees.

8. (cancelled)
- 10 9. (currently amended) The ~~low-IF~~ RF receiver of claim 7 wherein the phase calibration module further comprises a phase calibration device coupled between the first mixer and the second mixer.
- 15 10. (currently amended) The ~~low-IF~~ RF receiver of claim 7 further comprising an analog front end controller (AFE controller) coupled to and controlling ~~the amplitude calibration module and the phase calibration module so as to make the amplitude of the first signal and the second signal substantially equal and~~ make the phase difference of the first signal and the second signal substantially equal to 90 degrees.
- 20 11. (cancelled)
12. (currently amended) The ~~low-IF~~ RF receiver of claim 7 wherein the phase calibration module comprises a cross programmable gain amplifier (XPGA).
- 25 13. (currently amended) The ~~low-if~~ RF receiver of claim 7 being applied in a GSM communications system or a WLAN communications system.
14. (new) The RF receiver of claim 7 further comprising:

a complex filter, having input ports electrically connected to the phase calibration module.

15. (new) An RF receiver comprising:

- 5 a first mixer and a second mixer for receiving RF signals and respectively generating a first signal and a second signal that are at about quadrature phase angles;
- an amplitude calibration module coupled to at least one of the first mixer and the second mixer, for adjusting the amplitude of at least one of the first signal and the second signal so as to make the amplitude of the first signal and the second signal substantially equal; and
- 10 a complex filter, having input ports electrically connected to the amplitude calibration module.
